The Application:

Hevi-Rail™ Helps Customer Retain Business

This conveyor system manufacturer needed to upgrade their "older designed" conveyor system to a more reliable, heavy duty one that was safer to use and had a tension wheel with more control.

Because the old system couldn't trap the bearings, it created a safety hazard for their customers' employees. This safety hazard almost caused them to lose a major auto maker customer.

The old system used cold rolled angle iron with V-wheels and a floating wheel design in their conveyor take-up system.

The Solution:

Using a Hevi-Rail Heavy Duty Combined Bearing System with bearings and profile rails, this new design allowed for loading the tensioning wheel structure from left to right. This enabled the conveyor system maker to supply his customers with a more reliable and safer system. The end result...repeat business.

The Hevi-Rail Advantage:

- Safer system
- Combined running surfaces
- Structure pre-loaded from left to right
- Customer retains business
- Long lifetime bearings and profile rails
